DataRobot

# goals

**Using Python with R**

**Why Keras is important**

**Examples:**

**Telling 🐱 from 🐶**

😻 ... 🐱 ... 🐱 🐱 🐱

**Generating new 🐱**

# **Python & R**

## **wars**

python

R and Python are waging war:  
while both programming languages are gaining prominence  
in the data analytics community, they are fighting  
to become data scientists' language of choice.

Which side are you taking?

#4

## And The Winner is...

It's a tie!  
It's up to you, the data scientist,  
to pick the language that best fits your needs.  
The following questions can guide you in your decision.

1

What problems do you want to solve?

2

What are the net costs for learning a language?\*

\* it will cost time to learn a new system that is better aligned for the problem you want to solve, but staying with the system you know may not be made for that kind of problem.

3

What are the commonly used tool(s) in your field?

4

What are the other available tools in your field and how do these relate to the commonly used tool(s)?

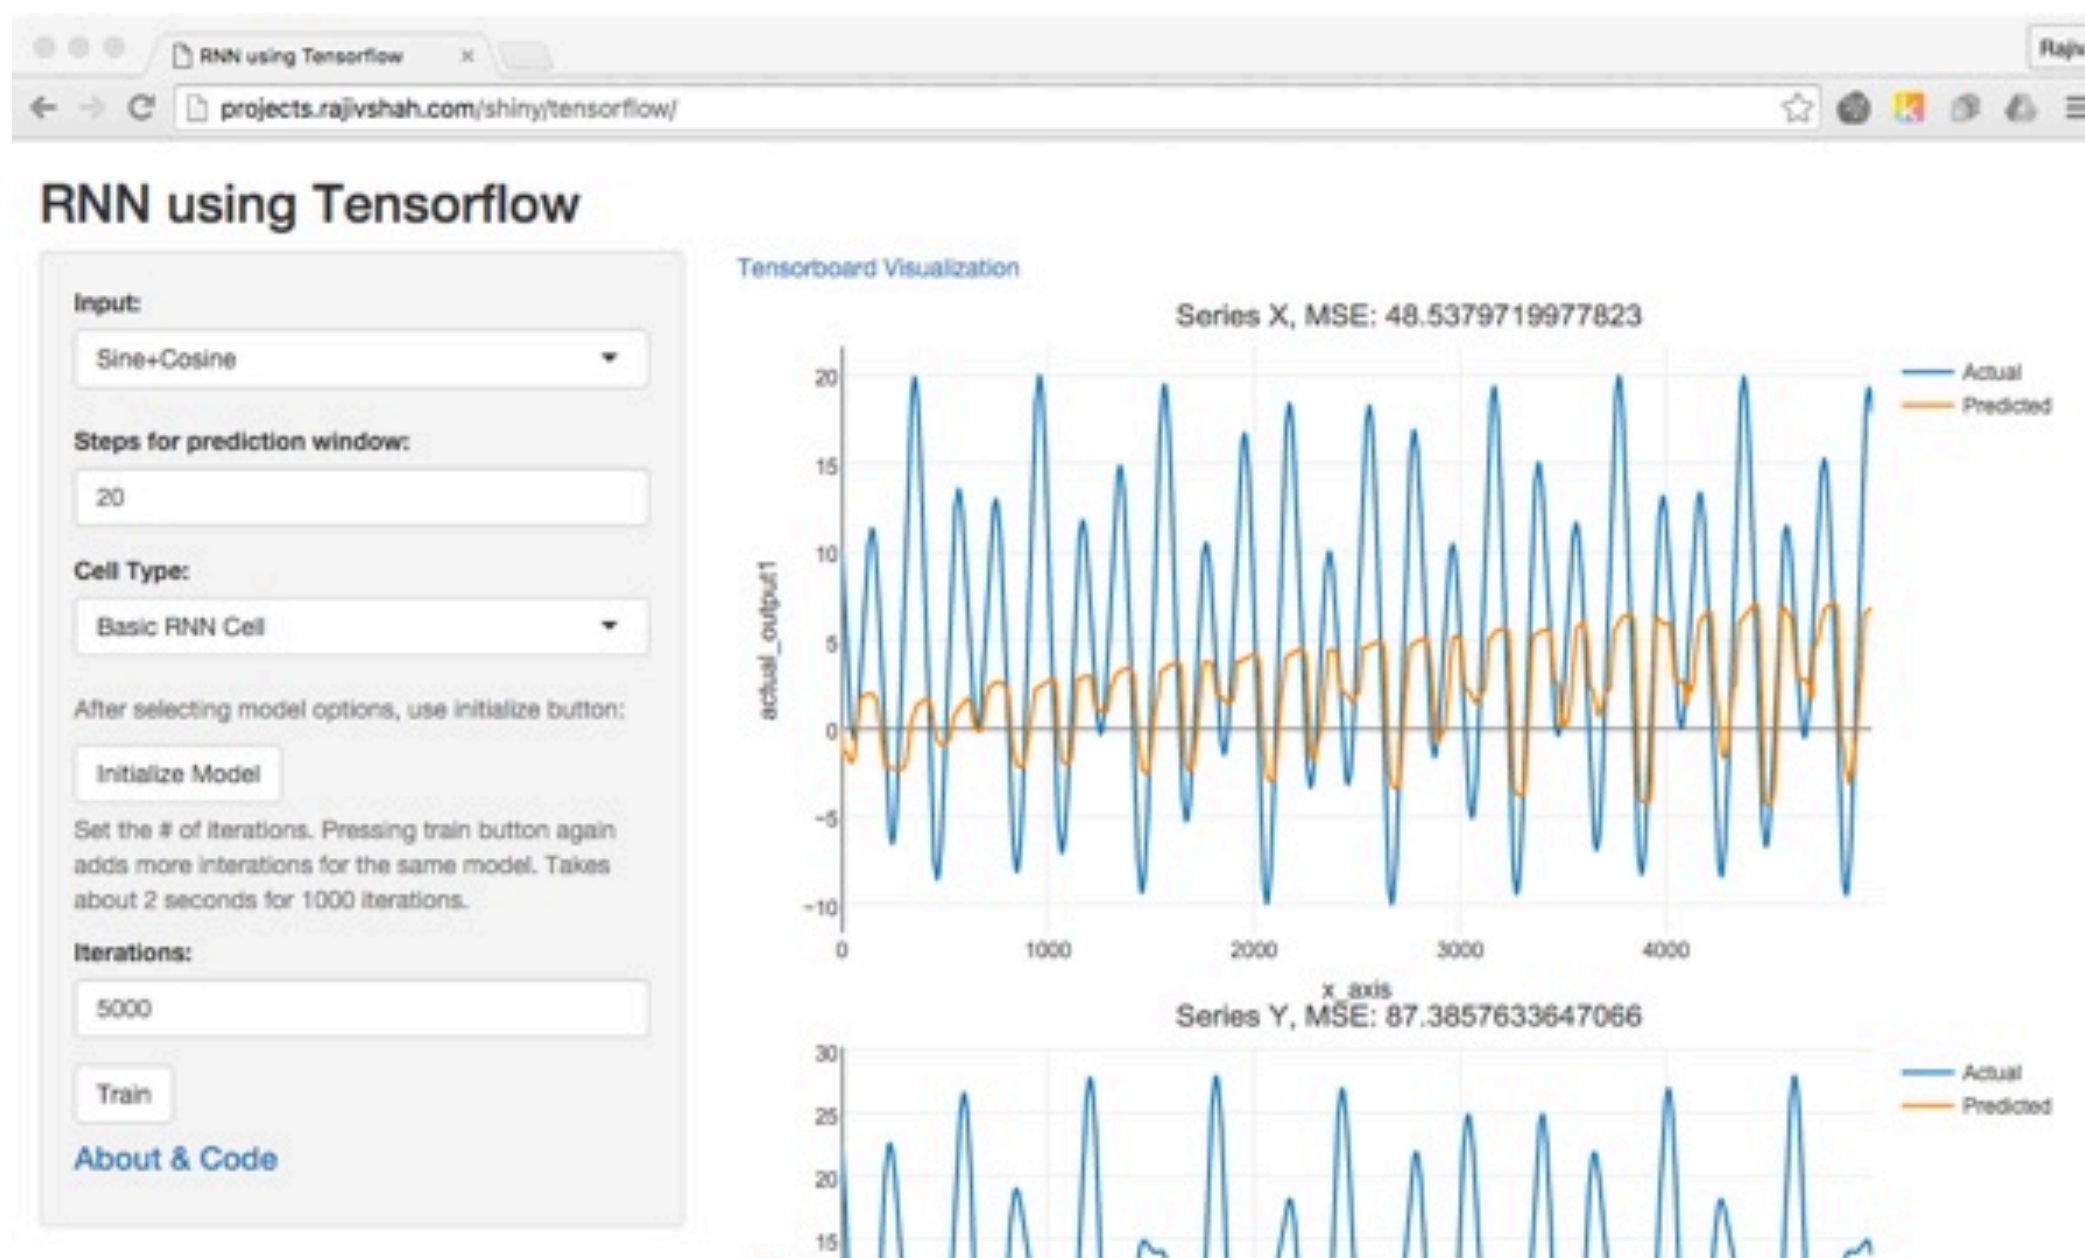

**Don't be a tool hater  
Room for both**

# **Python & R interfaces**

# rPython (c. 2010)

[https://github.com/rajshah4/tensorflow\\_shiny/](https://github.com/rajshah4/tensorflow_shiny/)

# rPython (c. 2010)

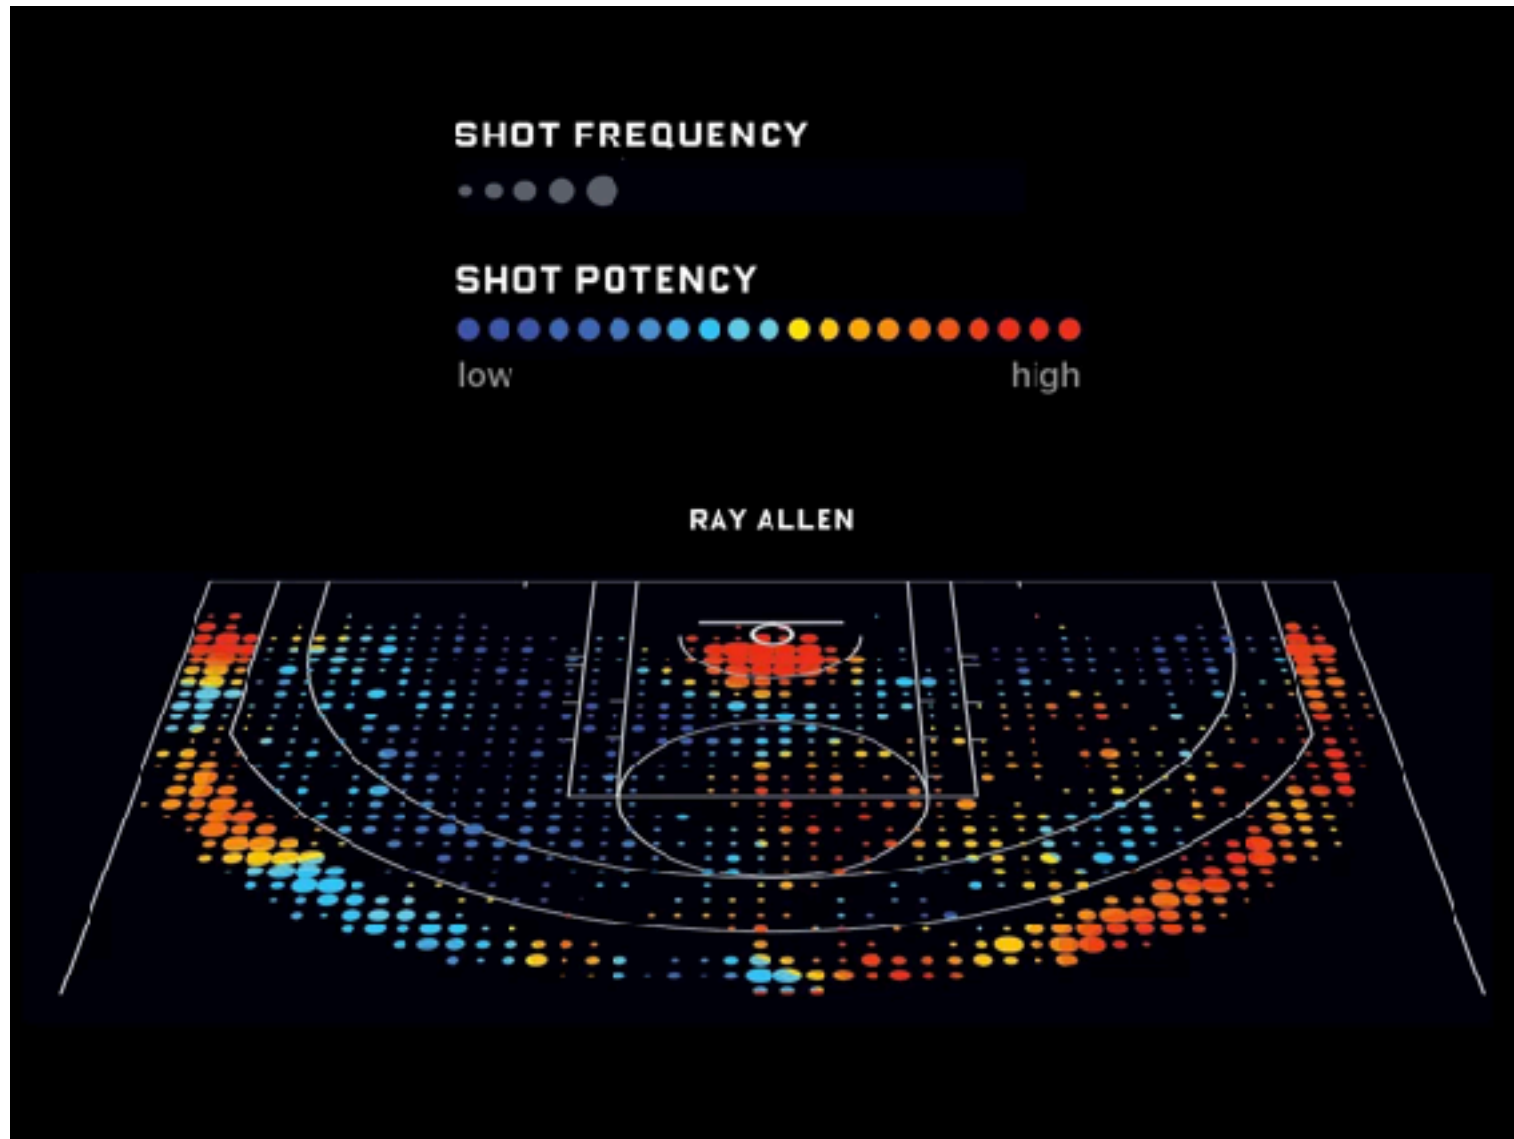

```
iw <- as.numeric(input$input_wave)-1
python.assign( "input_wave", iw )
python.assign( "prlag", input$prlag )
python.exec("
    lag = prlag
    def get_sample():
    global angle1, angle2
    angle1 += 2*pi/float(frequency1)
    angle2 += 2*pi/float(frequency2)
    angle1 %= 2*pi
    angle2 %= 2*pi
    return array([array([
    5 + 5*sin(angle1) + 10*cos(angle2)**input_wave,
    7 + 7*sin(angle2)**input_wave + 14*cos(angle1)]))]
")
```

# Tensorflow for R

## (Oct. 2016)

```
cross_entropy <- tf$reduce_mean(-tf$reduce_sum(y_ * tf$log(y_conv),  
reduction_indices=1L))  
  
train_step <- tf$train$AdamOptimizer(1e-4)$minimize(cross_entropy)  
  
correct_prediction <- tf$equal(tf$argmax(y_conv, 1L), tf$argmax(y_,  
1L))  
  
accuracy <- tf$reduce_mean(tf$cast(correct_prediction, tf$float32))  
sess$run(tf$global_variables_initializer())
```

  layer_activation("relu") %>%  
  layer_max_pooling_2d(pool_size = c(2,2)) %>%  
  
  layer_conv_2d(filter = 64, kernel_size = c(3,3)) %>%  
  layer_activation("relu") %>%  
  layer_max_pooling_2d(pool_size = c(2,2)) %>%  
  
  layer_flatten() %>%  
  layer_dense(64) %>%  
  layer_activation("relu") %>%  
  layer_dropout(0.5) %>%  
  layer_dense(1) %>%  
  layer_activation("sigmoid")
```

# techniques:

**Augment data**

**Use a pretrained convolutional neural network**

**Use transfer learning (fine tuning a pretrained network)**

# Not Hotdog

# augmentation

## Data augmentation for improving the model

By applying random transformation to our train set, we artificially enhance our dataset with new unseen images.

shear\_range: Rotate image by 0.2

zoom\_range: Zoom the image by 0.2

horizontal\_flip: Randomly flip inputs horizontally

rescale: rescaling factor (1./255)

```
train_generator <- flow_images_from_directory(train_directory,
      generator = image_data_generator(),
      target_size = c(img_width, img_height),
      color_mode = "rgb",
      class_mode = "binary",
      batch_size = batch_size,
      shuffle = TRUE,
      seed = 123)
```

# To augment data:

```
augment <- image_data_generator(rescale=1./255,  
                                shear_range=0.2,  
                                zoom_range=0.2,  
                                horizontal_flip=TRUE)
```

# pre-trained networks

# Load a pretrained network:

```
model_vgg <- application_vgg16(include_top = FALSE, weights = "imagenet")
```

# Save model weights:

```
save_model_weights_hdf5(model_ft, 'finetuning_30epochs_vggR.h5', overwrite = True)
```

# VGG architecture

Classical CNN topology - VGGNet (2013)

# Train only last few layers:

```
for (layer in model_ft$layers[1:16])  
  layer$trainable <- FALSE
```

# Complete Notebook

## Image Classification Done Simply Using Keras

by Rajiv Shah

You can find the code and data for this notebook at: [https://github.com/rajshah4/image\\_keras](https://github.com/rajshah4/image_keras)

The work here is based on the tutorial by Francois Chollet @fchollet <https://blog.keras.io/building-powerful-image-classification-models-using-very-little-data.html> and the workbook by Guillaume Domini <https://github.com/ggdomini/keras-workshop>

### Introduction

This tutorial presents several ways to build an image classifier using keras from just a few hundred or thousand pictures for each class.

We will go over the following options:

- training a small network from scratch (as a baseline)
- using the bottleneck features of a pre-trained network
- fine-tuning the top layers of a pre-trained network

This will lead us to cover the following Keras features:

- `fit_generator` for training Keras a model using data generators
- `ImageDataGenerator` for real-time data augmentation
- layer freezing and model fine-tuning
- ...and more.

### Data

The github repo includes about 3000 images for this model. The original Kaggle dataset is much larger. The purpose of this demo is to show how you can build models with smaller size datasets. You can improve this model by using more data, which is available at: <https://www.kaggle.com/c/dogs-vs-cats/data>

The recommended folder structure is:

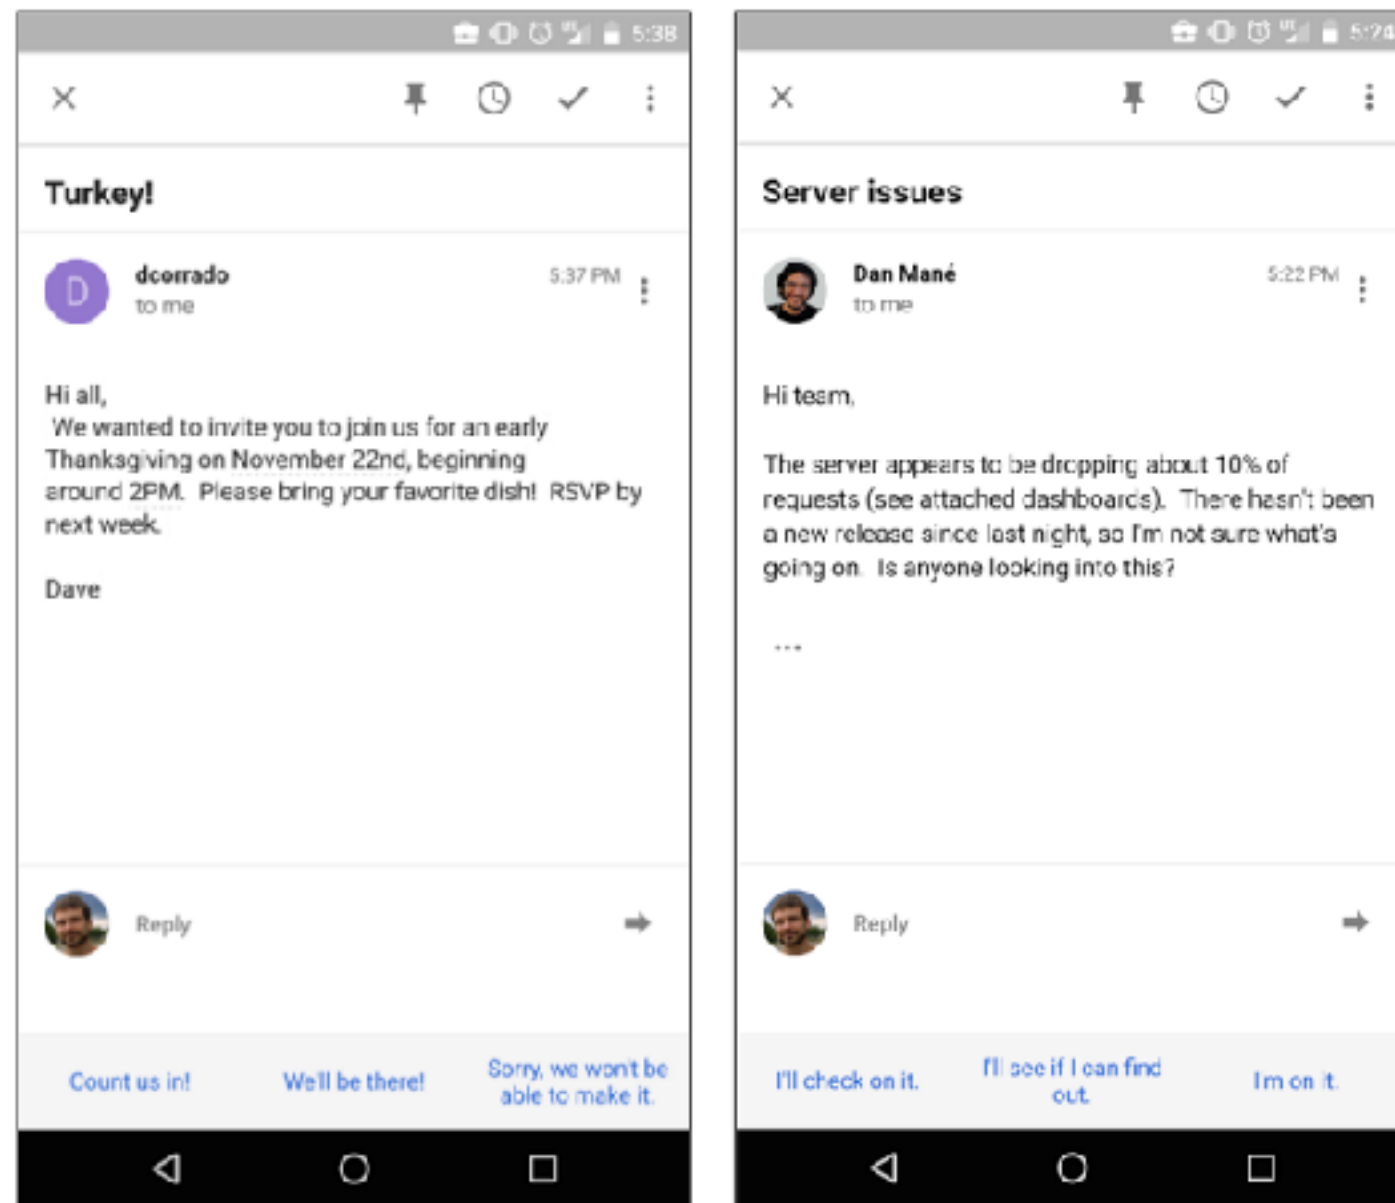

```
data/
├── train/
│   ├── dogs/ ### 1224 pictures
│   │   ├── dog001.jpg
│   │   ├── dog002.jpg
│   │   ├── ...
│   ├── cats/ ### 1224 pictures
│   │   ├── cat001.jpg
│   │   ├── cat002.jpg
│   │   ├── ...
│   └── validation/
│       ├── dogs/ ### 416 pictures
│       │   ├── dog001.jpg
│       │   ├── dog002.jpg
│       │   ├── ...
│       └── cats/ ### 416 pictures
│           ├── cat001.jpg
│           ├── cat002.jpg
│           ├── ...
```

### Loading Tensorflow and Keras

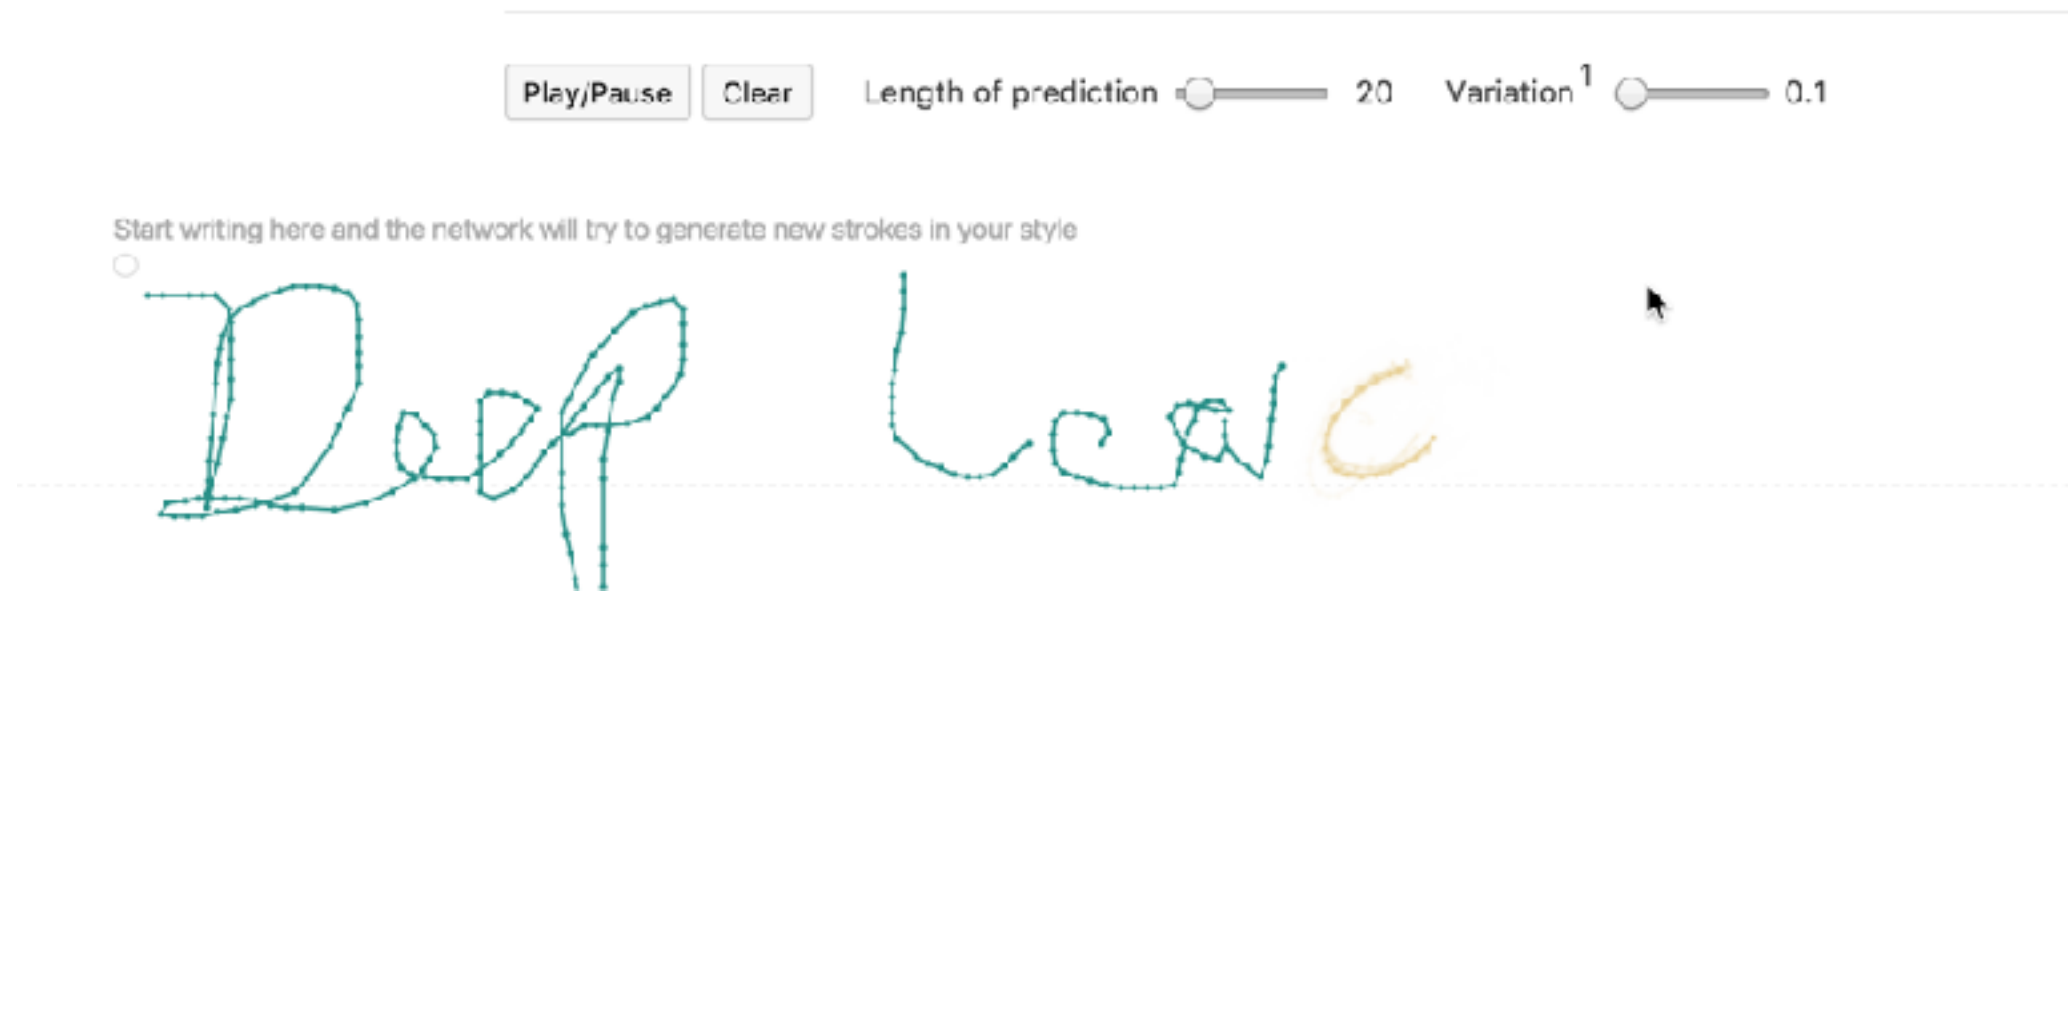

[https://github.com/rajshah4/image\\_keras](https://github.com/rajshah4/image_keras)

# smart reply

# demo: handwriting

# demo: basketball trajectories

# recurrent neural network

# Recurrent neural network

```
model <- keras_model_sequential()
model %>%
  layer_embedding(input_dim = max_features, output_dim =
128, input_length = maxlen) %>%
  bidirectional(layer_lstm(units = 64)) %>%
  layer_dropout(rate = 0.5) %>%
  layer_dense(units = 1, activation = 'sigmoid')
```

**Generating new** 🐱

# autoencoder

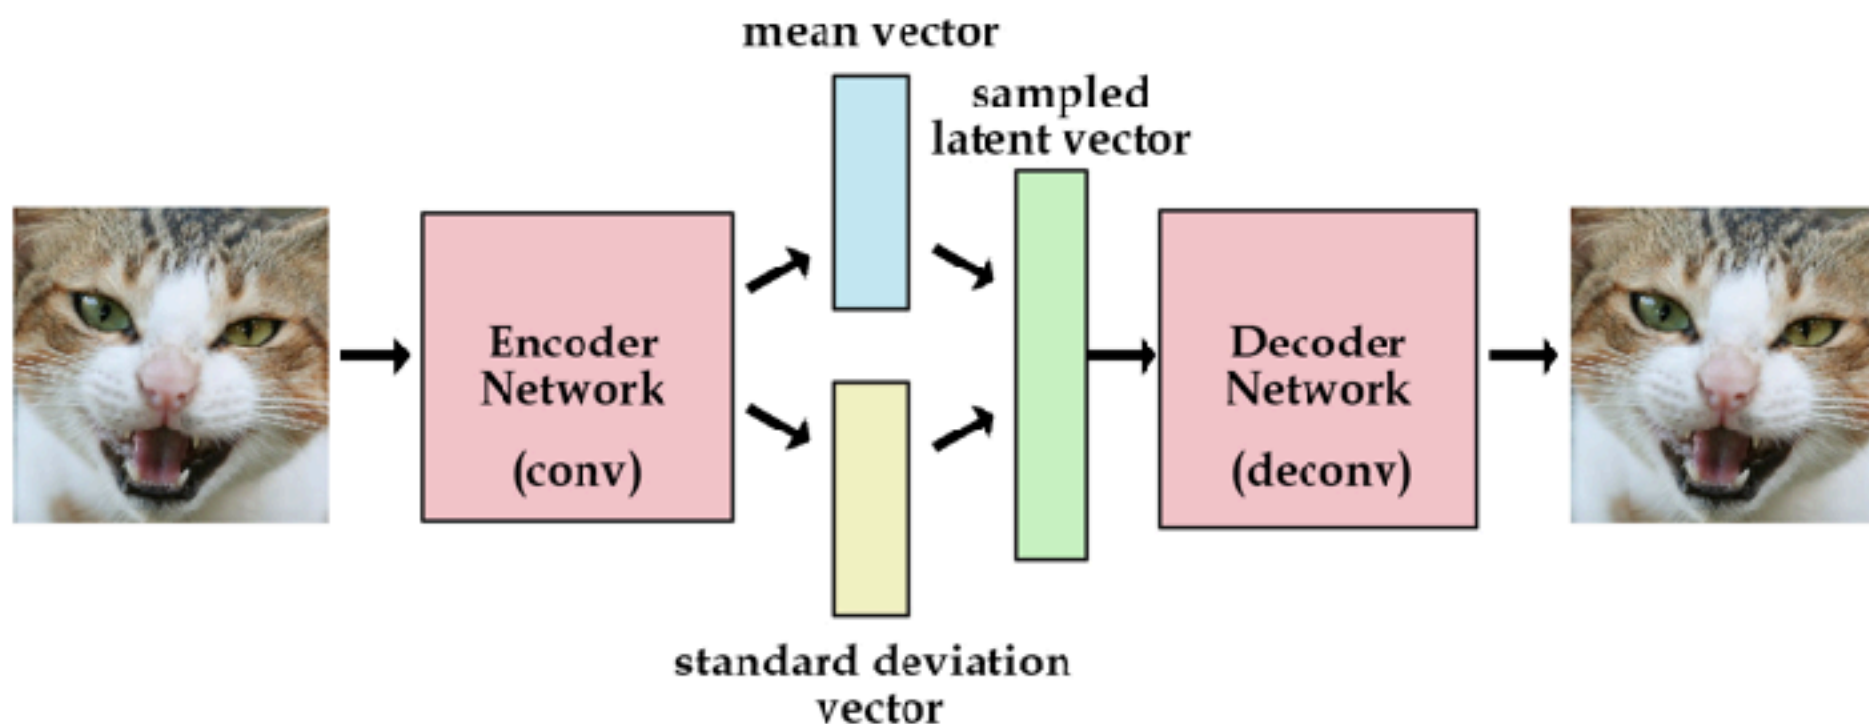

# Deep Autoencoder

```
input_img = Input(shape=(784,))
encoded = Dense(128, activation='relu')(input_img)
encoded = Dense(64, activation='relu')(encoded)
encoded = Dense(32, activation='relu')(encoded)

decoded = Dense(64, activation='relu')(encoded)
decoded = Dense(128, activation='relu')(decoded)
decoded = Dense(784, activation='sigmoid')(decoded)
```

# variational autoencoder

# VAE loss

```
vae_loss <- function(x, x_decoded_mean){  
  xent_loss <- (original_dim/1.0)*loss_binary_crossentropy(x,  
x_decoded_mean)  
  kl_loss <- -0.5*K$mean(1 + z_log_var - K$square(z_mean) -  
K$exp(z_log_var), axis = -1L)  
  xent_loss + kl_loss  
}
```

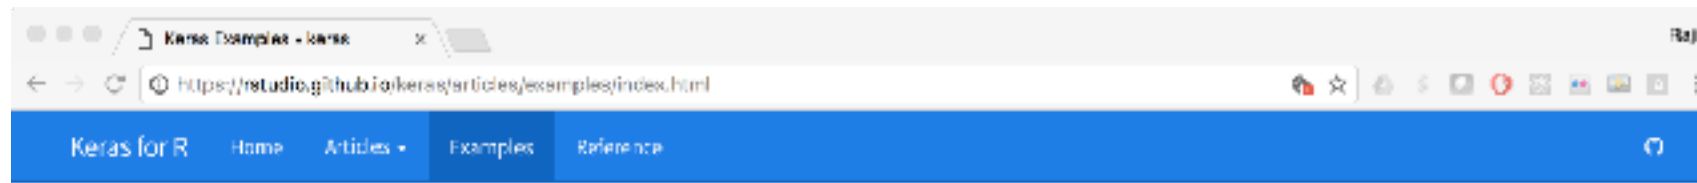

# MNIST

# QuickDraw

# More examples . . .

The screenshot shows a web browser window with the title 'Keras Examples - keras'. The address bar displays the URL 'https://rstudio.github.io/keras/articles/examples/index.html'. The navigation bar includes links for 'Keras for R', 'Home', 'Articles', 'Examples' (which is highlighted), and 'Reference'. The main heading is 'Keras Examples'. Below it is a table with two columns: 'Example' and 'Description'.

Example	Description
<a href="#">addition_rnn.R</a>	Implementation of sequence to sequence learning for performing addition of two numbers (as strings).
<a href="#">babi_memnn.R</a>	Trains a memory network on the babi dataset for reading comprehension.
<a href="#">babi_rnn.R</a>	Trains a two-branch recurrent network on the babi dataset for reading comprehension.
<a href="#">cifar10_cnn.R</a>	Trains a simple deep CNN on the CIFAR10 small images dataset.
<a href="#">deep_dream.R</a>	Deep Dreams in Keras.
<a href="#">imdb_bidirectional_lstm.R</a>	Trains a Bidirectional LSTM on the IMDB sentiment classification task.
<a href="#">imdb_cnn.R</a>	Demonstrates the use of Convolution1D for text classification.
<a href="#">imdb_cnn_lstm.R</a>	Trains a convolutional stack followed by a recurrent stack network on the IMDB sentiment classification task.
<a href="#">imdb_fasttext.R</a>	Trains a FastText model on the IMDB sentiment classification task.
<a href="#">imdb_lstm.R</a>	Trains a LSTM on the IMDB sentiment classification task.
<a href="#">lstm_text_generation.R</a>	Generates text from Nietzsche's writings.
<a href="#">mnist_cnn.R</a>	Trains a simple convnet on the MNIST dataset.
<a href="#">mnist_rnn.R</a>	Reproduction of the IRNN experiment with pixel-by-pixel sequential MNIST in "A Simple Way to Initialize Recurrent Networks of Rectified Linear Units" by Le et al.
<a href="#">mnist_mlp.R</a>	Trains a simple deep multi-layer perceptron on the MNIST dataset.
<a href="#">mnist_transfer_cnn.R</a>	Transfer Learning toy example.
<a href="#">reuters_mlp.R</a>	Trains and evaluates a simple MLP on the Reuters newswire topic classification task.
<a href="#">stateful_lstm.R</a>	Demonstrates how to use stateful RNNs to model long sequences efficiently.

# **whew . . .**

**No more python versus R**

**You can use python packages in R**

**How to use Keras in R for:**  
**convolutional neural networks**  
**recurrent neural networks**  
**variational auto encoders**
